DOES SPRAY FOAM REALLY MAKE A HOME MORE COMFORTABLE?

COMFORT CANNOT BE MEASURED.

Comfort is an experience. An increase in comfort cannot be proven with data.

However, discomfort is usually caused by air leakage and drafts.

Spray foam insulation offers an airtight seal, which can reduce air leakage.

In the summer, an airtight seal stops heat from pressing through your attic.

In the winter, an airtight seal stops heat from escaping through your attic.

Different applications offer different results. Key areas of your thermal envelope make the most impact.
