HOW TO INSULATE AN ATTIC WITH SPRAY FOAM

STEP ONE

- Remove existing insulation.

STEP TWO

- Set up ventilation to exhaust off-gassing fumes.

STEP THREE

- Install spray foam insulation on the floor (vented attic) or on the underside of the roof and gables (unvented attic).

HIRE A PROFESSIONAL

DIY spray foam kits do not provide the necessary equipment and PPE for a successful chemical reaction. It's best to hire a qualified installer, especially for a project as large as an attic.
