WHAT TIME OF YEAR IS BEST FOR SPRAY FOAM?

Spray foam is best installed in warm weather. Climate has little bearing on the foam as long as the temperature is above the 50- to 60-degree mark.

Spray foam can still be installed safely in the winter. Many winter days have temperatures below 50 degrees Fahrenheit, but **competent contractors can still install safe and functional foam.**

- Wintertime spraying techniques
- Winter blend foam varieties

Dew point and substrate must be carefully monitored in the winter.
